ROME, 1975

FISHING BOAT DESIGNS: 1

FLAT BOTTOM BOATS

Compiled by

**Arne Fredrik Haug
Fishing Vessels and Engineering Branch
Fishery Industries Division**

PREPARATION OF THIS PAPER

The paper contains a selection of designs of flat bottom boats suitable for fishing and transport work in lakes, rivers and protected coastal waters. The paper and the designs were prepared to provide detailed technical information to boatbuilders and Fishery Officers in interested member countries. First published in 1972, this 1974 revised edition by J.F. Fyson contains the same basic designs, updated in accordance with experience gathered during construction and operation of some of the boats presented, notably AFR-1, IVC-4, IVC-6, PDY-1, SW-1 and IVC-7.

Distribution:

FAO Department of Fisheries

1. INTRODUCTION

THE PURPOSE OF THIS PUBLICATION is to present some basic designs of boats that are simple to construct, for use in small-scale, non-industrial fisheries. All the designs shown here are of the flat bottom type; that is: the bottom is flat when seen in the transverse direction, while lengthwise there is a slight curvature. In the majority of the present designs, the shape is simplified to the extent that the sides are built up with parallel planks and the rocker of the bottom is determined simply by the curvature and the flare of the side planks, so no building jig is necessary.

THE EASE OF CONSTRUCTION of flat bottom boats, because of the simple, straight-lined frames and the uncomplicated planking, is considered to be their main advantages, realizing also that this normally makes them the least expensive of all planked wooden boats.

THE SHALLOW DRAUGHT is an important feature for many purposes like navigation on shallow rivers and lakes or in swamp areas or close to the shore. For beach landing operations, it means that the boat can be kept afloat until it actually touches the beach, and because of its flat bottom it rests firmly on the ground after hauling up.

GOOD TRANSVERSE STABILITY when compared with round bilge or V-bottom boats with the same weight and overall beam is another advantage of flat bottom boats. This means that they give a stable working platform for fishing operations.

BIG FLOOR SPACE INSIDE THE BOAT is a valuable asset for certain fishing operations like gillnetting or pot fishing where a working position standing near the side is normal; this is another easily possible, favourable feature of the flat bottom boat configuration.

THE ADAPTABILITY FOR SERIES PRODUCTION is high, utilizing simple moulds and templates; series production is possible with a small labour force. In one country in Africa, the system of kit production in a central place with good access to suitable timber, and assembly in the different fishing villages, has been introduced with great success.

EXPERIENCED BOATBUILDERS are not necessary for the construction of flat bottom boats since the amount of difficult boatbuilding work is reduced to a minimum. Knowledge of general carpentry is required, supplemented with a few weeks training in this particular type of construction.

STANDARD SIZES OF TIMBER can be used throughout in the majority of the designs presented. The requisite timbers can be obtained directly from the timber store or saw mill without spiling or other difficult adjustments of the edges being required. Since standard timber sizes are different in different countries and strength and stiffness are not the same for all boatbuilding timbers, the specifications given should be taken more as guidelines than as strict instructions.

THE MAIN DISADVANTAGES of flat bottom boats are their general tendency to slamming in waves, resulting in discomfort, and requiring speed reduction, and the tendency to side-drift in wind and waves, due to lack of a deep keel. These features restrict the area of use for these boats to protected waters, inland waterways and some lakes. Spray and water that enter the boat can also be quite uncomfortable, since there are no bilges where this water can be collected and easily bailed or pumped out.

THE BOAT DESIGNS presented here are suitable where low cost, or ease of construction, are all important factors and where a somewhat reduced seaworthiness or seakindliness can be accepted, or where extreme shallow draft requirements are an over-riding consideration.

2. BUILDING PROCEDURES

THE SIMPLEST VERSIONS of flat bottom boats have cross-laid bottom planks nailed directly to the sides, and the lower side planks on each side are increased in thickness to take the nails without splitting. The frames are mainly necessary to hold out the sides during construction, because the main transverse strength comes from the cross-laid bottom planks. The bottom planks have to be held together by longitudinal bottom stiffeners, and the side planks by vertical side stiffeners (intermediate side frames). A slight bending of the bottom planks when crossing waves can be tolerated as long as it does not affect watertightness. Except for MLW-6, which is built over a jig, when one or several boats only are to be built the construction procedure is as follows:

1. Select timber and fastenings according to specifications on drawings (see Chapters 3 and 4 regarding selection of timber and fastenings).
2. Make templates for frames and transom.
3. Prefabricate frames, transom and stem complete with bevels.
4. Join lower side planks to obtain the required length using butt blocks on the inside. Mark position of all main frames and intermediate frames.
5. Assemble the lower side planks, frames, stem and transom on the ground or on a flat floor. When this is done the shape of the boat is given.
6. Fasten side stiffeners to lower side planks and complete side planking.
7. Turn the boat over, check the bevel on the lower side planks for a perfect fit with the bottom planks. Start planking the bottom from the stern, working toward the stem. Apply a strand of cotton and bitumastic compound in the joint between the sides and the bottom. If the bottom planking is made of a timber that swells and shrinks considerably it is necessary to leave a gap, the thickness of a hacksaw blade between the planks. Never fit the bottom planks tight if they are made of pine or similar timber since the bottom planks will buckle as they swell. With most stable tropical hardwoods, however, the bottom planks can be fitted tight on the inside with a small outgauge for caulking the outside.
9. Apply wood preservative on all surfaces. A strand of cotton is driven into the seams with a proper caulking iron and not a screwdriver, chisel or putty knife. The seam is finally rendered watertight by filling the joint with bitumastic compound.
10. Painting the outside of the bottom with bitumastic paint is the best and cheapest way. The sides can be painted but application of wood preservation will give a better and cheaper protection to the timber against rot.

When series production of 10 or more boats is envisaged, building upside down over a jig is the quickest and most economical method. In this case the construction procedure follows that shown for boat MLW-6. Slight differences in procedure may be necessary to incorporate fixed frames which are indicated in some designs and these should be prepared and fitted to the jig with the moulds and permanently fastened to the hull before it is removed from the jig.

3. SELECTION OF TIMBER

THE MAIN QUALITIES sought in a boatbuilding timber are:

(a) Rot resistance - Rot is the main enemy of wooden boats operating in tropical fresh water and the timber should be selected with this in mind. The types of timber with high natural resistance to rot are normally known by the boatbuilders in the area but Forestry Departments will also be able to give precise information regarding durability of various local timbers.

High resistance to rot can also be achieved by pressure-impregnation of timbers. The local Forestry Department can give advice on which species of timber would be suitable. Besides being easily treated by pressure-impregnation it must be relatively stable, with good strength qualities and not split easily when nailed or screwed.

(b) Stability - A timber that is not stable will shrink excessively when it dries out and thereby open up the seams with resulting leaks. On the other hand, if the same timber is dry when the boat is being built the bottom planks will swell excessively after being put into water causing great strain on the fastenings and making the planks buckle with consequent leaks along the chine. The tangential shrinkage should preferably be below 4 percent when dried from green to 15 percent humidity. The best hardwoods have a tangential shrinkage of only 2 percent - a boat built of such timber will, therefore, have less problems with leakage due to swelling and shrinkage.

(c) Good strength qualities - The weight of the timber will give an indication of the strength. The heavier the timber is the stronger it will be. A heavy timber will, therefore, permit a slight reduction in planking thickness compared with a lighter timber.

(d) Take nails and screws without splitting - The problem of splitting when nailing the planks can partly be solved by preboring holes for the nails. Holes for screws must always be prebored.

4. SELECTION OF FASTENINGS

- (a) All nails, screws and bolts should be hot-dipped galvanized.
- (b) Copper nails or brass screws are expensive and their use is not warranted for boats operating in fresh water.
- (c) Bolts should be of carriage type with cupped head and a square nut. A galvanized washer should be placed under the nut.
- (d) The type of galvanized nails to be used is often determined by what is available. Round nails or square nails are both acceptable but the diameter should not be less than $1/7$ of the plank thickness and the length at least $2\frac{1}{2}$ times the plank thickness. For example, for 20 mm planking nails should have a minimum diameter of 3 mm and a minimum length of 50 mm.
- (e) If the timber has a tendency to split, a hole slightly smaller than the nail diameter should be drilled before nailing. If the nail is to be clenched, the nail should be tapped over at the end and, with a dolly against the nailhead, tapped down so that the point enters the wood and hammered hard down to draw up tight. The point should be clenched across the grain, not along the grain since this often leads to splitting.

Weight pr.m (at 0.65 kg/dm ³)	2.50 kg	1.25 kg	2.80 kg	1.40 kg	2.20 kg
---	---------	---------	---------	---------	---------

Side planking	2 x 4.90 m		2 x 4.75 m	2 x 5.00 m	
Bottom planking	23.00 m				
Frames				6.00 m	
Stem piece					0.75 m
Transom	0.80 m	0.85 m	1.50 m	0.90 m	
Side stiffeners		5.50 m			
Bottom stiffener		1 x 4.20 m			
Keel and skeg				1 x 4.50 m 1 x 1.50 m	
Thwarts and knees	1.20 m		4.00 m		

Total length	34.80 m	10.55 m	15.00 m	22.90 m	0.75 m
Weight	87 kg	13 kg	42 kg	32 kg	2 kg

The timber should preferably be medium heavy and medium hard with good holding power for nails and low tendency to split.

For maximum durability, the timber should be treated with the best locally available impregnation system, preferably pressure impregnation of all planks before the construction.

CAULKING :

All joints should be treated with an asphalt-based or bitumastic compound during the construction. It may be necessary to caulk eventual bad leaks with caulking cotton afterwards.

FASTENINGS :

For assembly of frames : galvanized 50 x 5 mm flat head wood screws.

Elsewhere : 60 x 3.0 mm galvanized round nails.

	4.90 m Flat bottom boat		
	MATERIALS		
	Scale	Boat No.	Drwg. No.
Design	<i>Alfano</i>	AFR-1	2
Rome, November 1971			

BUILDING INSTRUCTIONS :

1. Prepare : frames
transom
stem piece
lower side planks
2. Assemble on a flat ground or on a floor.
Fix frames temporarily with diagonal battens.

NOTE 1: After this first stage of assembly, it is convenient to place the boat on two saw-horses approx. 1.30 m long and 0.60 m high.
Planking of the bottom will be done with the bottom up.
(See Boat No. IVC-4, Drawg. No. 3)

NOTE 2: For series production of 10 or more units the boats should be built upside down over a jig similar to that in Boat MLW-6, Drawg. No. 6 but with frames A and B permanently fitted before hull is removed from the jig.

	4.90 m Flat bottom boat		
	CONSTRUCTION 1st STAGE		
Scale	Boat No.	Drawg. No.	
Design	AFR-1	3	
Rome, November 1971			

Building instruction continued :

3. Fix side stiffeners and complete planking of the sides.
4. Turn the boat and fix the bottom stiffener temporarily.
5. Complete planking of the bottom.
Use Masticon or bitumastic compound in all joints.
6. Fix the bottom stiffener and keel and skeg permanently.
7. Prepare and fix thwarts and knees.
8. Round off all corners and edges and apply wood preservative and paint.

Rome, October 1971		

5. Control the bevel of the transom with a flexible batten laid over the moulds.
6. Fix the keelson 30 x 70 to transom and stem.
7. Place the two side planks 20 x 150 with the bottom edge in line with marks on the transom, moulds and stem and fix. Let the planks bend without forcing up or down.
8. Fix temporary batten 25 x 50 along chine. The batten helps to keep the side frames in place.
9. Fasten the side frames 25 x 50 with nails to the side planks. Start from aft and place them with a distance of 40 cm. between.

5.40 m Flat bottom boat
CONSTRUCTION 2nd STAGE

Designed *P. Lombardi*
Rome, October 1971

MLW-6-4

10. Plank the sides up with planks 20 x 150 nailing to the frames. A man on the inside must support the frames during nailing.
11. The top plank is wider than the others and is sawn off to align with the top of the moulds. Bevel off the top after fastening to take the bottom plank.
12. Chine batten 20 x 50 is fixed along top edge of side planks and beveled off for bottom planks.

Chine batten 20 x 50 fastened after top side plank has been beveled off

The side planks are of same dimensions 20 x 150.
 Top plank is made from a plank 20 x 200 and sawn off to fit the top of the moulds. It is then beveled off to take the bottom planks.
 Chine batten is fastened on the outside and beveled off.

5.40 m Flat bottom boat
 CONSTRUCTION 3rd STAGE
 Designed *P. Luchini*
 Rome, October 1971

MLW-6-5

13. Use sufficient Bitumastic compound in the joint between bottom and sides. Nail the bottom planks 20 x 150 to the keelson and the sides.

14. Caulk the sides and the bottom and fill the seams with bitumastic compound

15. Fix the outer keel 30 x 70 with nails through the bottom planks into the keelson.

16. Bolt the skeg and the outer stem with 10 mm galvanized bolts.

Keel 30 x 70 is fixed after bottom planking is completed. Use galvanized boat nails 50 mm (2 in.)

Bottom planked with boards 20 x 150 starting from aft. Use galvanized boat nails 50 mm (2 in.)

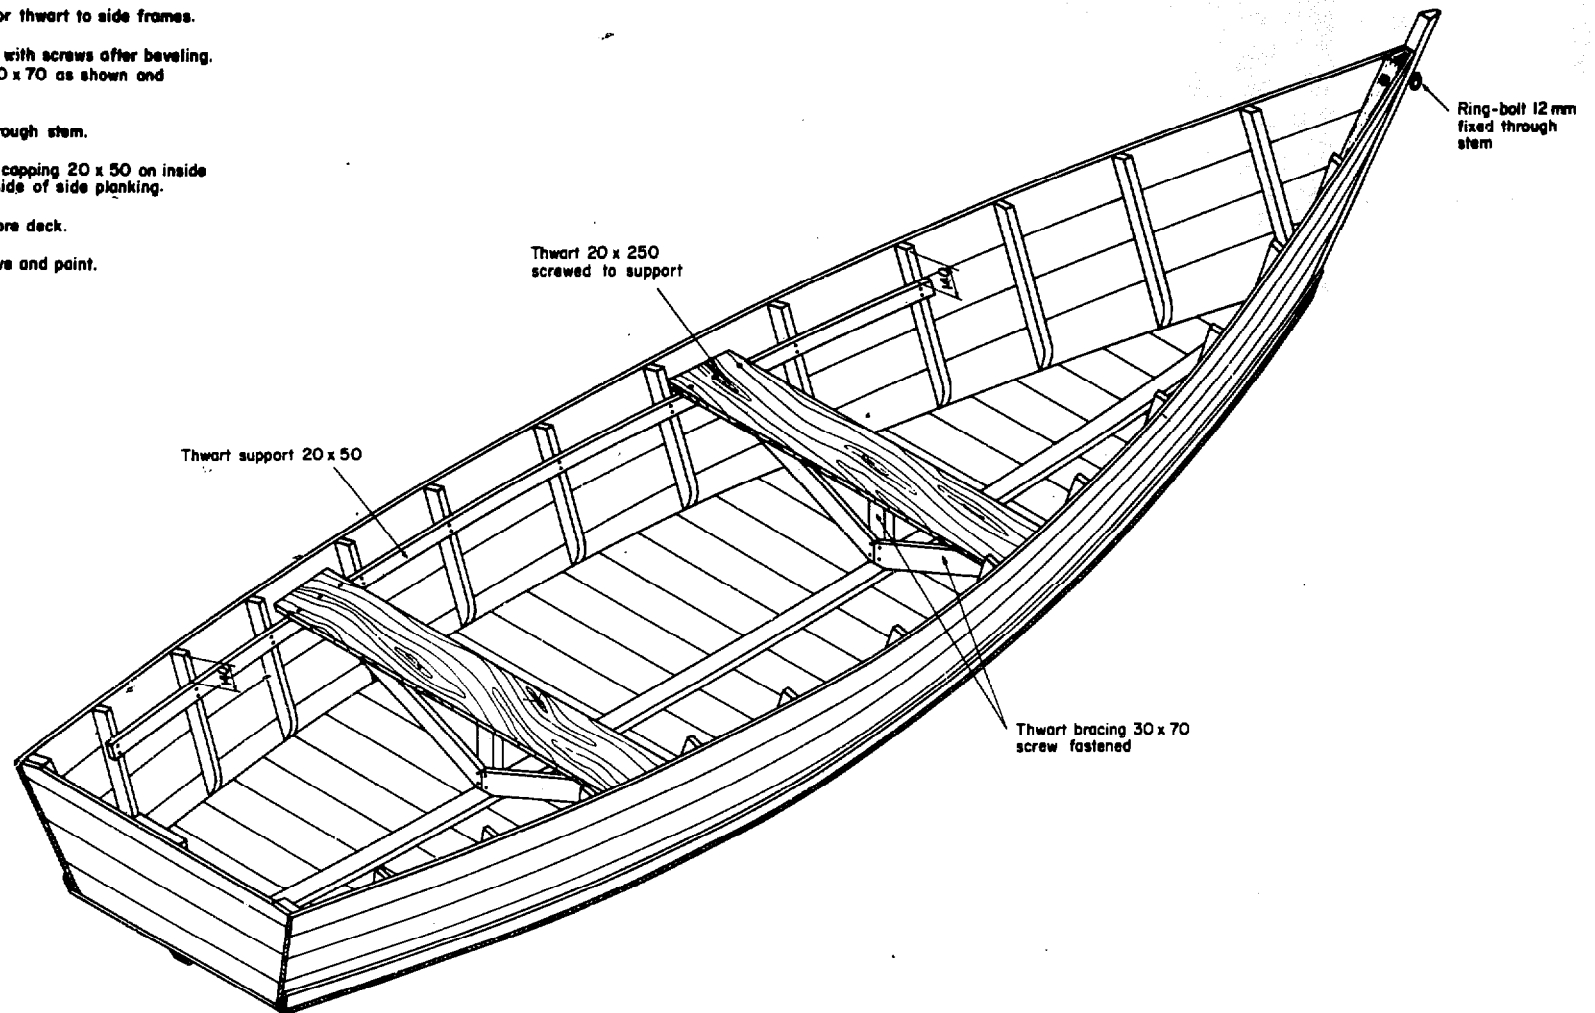

Outer stem made from 50 x 70 x 900

Skeg 50 x 70 length 800 reduced in height forward. Fixed with galvanized bolts 10 mm ($\frac{3}{8}$ in.)

	5.40 m Flat bottom boat
	CONSTRUCTION 4 th STAGE
<i>Designed by</i>	MLW-6-6
	Rome, October 1971

17. Release the moulds from the jig and turn the boat over.
18. Place a temporary transverse bracing on inside of boat and remove the moulds.
19. Fix support 20 x 50 for thwart to side frames.
20. Fix thwarts to support with screws after beveling. Place thwart bracing 30 x 70 as shown and fasten well.
21. Fix 12 mm ring-bolt through stem.
22. Fasten battens for rail capping 20 x 50 on inside of frames and on outside of side planking.
23. Fix rail capping and fore deck.
24. Apply wood preservative and paint.

ALTERNATIVE TRANSOM

For std. shaft outboard engines

	5.94 m Flat bottom boat		
	DETAILS, MATERIALS		
	Scale	Boat No.	Drwg. No.
	Design Rome, November 1971	IVC-6	2

BUILDING INSTRUCTIONS :

1. Prepare : frames
transom
stem piece
lower side planks.
2. Assemble the above items on a flat ground or a floor.
Fix frames temporarily with diagonal battens.
3. Fix side stiffeners and complete planking of the sides.
4. Turn the boat and fix the bottom stiffeners temporarily.
5. Complete planking of the bottom.
Use Masticon or bitumatic compound in all joints.
6. Fix the bottom stiffeners permanently.
7. Prepare and fix keel and skeg.
8. Fix seam battens on transom.
9. Prepare and fix thwarts and knees.
10. Round off all corners and edges.
11. Apply wood preservative and paint.

REMARK : See Boat No. IVC-4, Drwg. No. 3 and
Boat No. AFR-1, Drwg. No. 3 for procedure of construction.

MAIN PARTICULARS.

Lenght over all	5.94 m (19 ft 6 in)
Beam over all	1.94 m (6 ft 4 in)
Depth	0.56 m (1 ft 10 in)
Weight approx.	408 kg
Propulsion :	outboard engine up to 20 hp
Purpose :	gillnetting, general purpose

5.94 m Flat bottom boat COMPLETED BOAT

Scale	Boat No.	Drwg. No.
Design	IVC-6	3
Rome, November 1971		

IVC-5

6.80 m

Flat bottom canoe

LOWER SIDE PLANK

Measurements are given in millimetres.

MAIN PARTICULARS

Length over all 6.80 m (22 ft 4 in)
Beam over all 1.19 m (3 ft 11 in)
Depth 0.43 m (1 ft 5 in)
Weight approx. 210 kg
Propulsion : paddling or outboard up to 5 hp
Purpose : gillnetting, handlining, general purpose

6.80 m Flat bottom canoe ARRANGEMENT, DETAILS
Scale as shown Boat No. *77* Drawg. No. *77*
Design *77*
Romb, November 1971 **IVC-5** 1

TIMBER SPECIFICATIONS :

						
	16x190 mm	20x95 mm	26x145 mm	26x95 mm	26x70 mm	45x95 mm
Weight pr.m(at 0.65kg/dm ³)	2.00 kg	1.00 kg	2.45 kg	1.60 kg	1.20 kg	2.20 kg
Side planking	15.00 m		14.50 m	15.50 m		
Bottom planking	26.00 m					
Frames					11.00 m	
Stem pieces			0.90 m			0.90 m
Transom			1.60 m		1.00 m	
Side stiffeners		7.00 m				
Bottom stiffener	5.80 m	2 x 3,40 m				
Keel and skeg					7.60 m	
Thwarts and knees	0.70 m		3.70 m			
Total length	47.50 m	13.80 m	20.70 m	15.50 m	19.60 m	0.90 m
Weight	95 kg	14 kg	51 kg	25 kg	24 kg	2 kg

The timber should preferably be medium heavy and medium hard with good holding power for nails and low tendency to split.

For maximum durability, the timber should be treated with the best locally available impregnation system, preferably pressure impregnation of all planks before the construction.

CAULKING :

All joints should be treated with an asphalt-based or bitumastic compound during the construction. It may be necessary to caulk eventual bad leaks with caulking cotton afterwards.

FASTENINGS :

For assembly of frames : galvanized 45 x 5 mm flat head wood screws.
 For planking of bottom : 50 x 2.7 mm galvanized round nails.
 Elsewhere : 60 x 2.7 mm galvanized round nails.

MAIN PARTICULARS

Length over all	8.23 m	(27 ft 0 in)
Beam over all	1.80 m	(5 ft 11 in)
Depth	0.57 m	(1 ft 10 in)
Draft approx.	0.38 m	(15 in)
Weight approx.	700 kg	
Propulsion	inboard engine 6-8-10 hp fishing, transportation where shallow draft and protected propeller is important.	
Purpose		

SPECIFICATIONS

ENGINE: shown is Yanmar PMX P
Continuous 8.5 hp at 2100 rpm,
Red gear 2.31:1, weight 175 kg

PROPELLER: 15 1/2 in dia x 13 in pitch (400 mm x 330 mm)
clockwise rotation

STERN GEAR: 1.30 m (4 ft 3 in) bronze tail shaft 25 mm
(1 in) diameter, shaft log with self-aligning stuffing
box; single arm strut with water lubricated rubber
bearing

RUDDER GEAR: two sets of galvanized steel
straps 150 mm with 10 mm girths and drilled
brackets to fix on transom

FASTENINGS: for keel and engine beds
10 mm (3/8 in) steel rod cut to correct size and
threads cut in each end to take nuts and washers,
protected against corrosion, preferably
galvanized.

	DETAILS		
	Scale	Boat No.	Drwg. No.
	Design Rome, November 1971	IVC-7	2

BUILDING INSTRUCTION :

1. Prepare: frames
mould for station C
transom
inner stem
lower side planks
2. Assemble the above items on a flat ground or a floor.
Fix side planks first to the mould at station C, then bend around frames B
and fix to stem and transom. Fix frames A afterwards.
Keep structure in position with diagonal battens. (See Boat No. AFR-1, Drwg. 3)
3. Fix side stiffeners to lower side planks.
4. Complete planking of the sides.
5. Prepare and fix thwarts
6. Complete sheer clamp and covering board.
7. Turn the boat.
8. Fix inside bottom stiffeners temporarily.
9. Complete planking of the bottom.
Use Masticon or bitumastic compound in all joints.
10. Fix thoroughly the inside bottom stiffeners.
11. Prepare and fix keels and skeg.
12. Fill all visible gaps between planks with bitumastic compound.
13. Fix chine and batten.
14. Round off corners and edges as required.
15. Apply wood preservative and paint.

11.25 m Transport boat COMPLETED BOAT

Scale	Boat No.	Drwg. No.
Design	IVC-7	4
Rome, November 1971		

ENGINE SPECIFICATION :

- Lister air cooled marine diesel engine SR 2 MG/R, 13 hp at 2000 rpm, with :
- Gearbox mechanical 2:1 reduction
 - Fuel tank separate - 10 gallons (45.5 litres)
 - Fuel lift pump
 - Fuel pipe and connections, 8 ft length
 - Exhaust pipe flexible 18 in
 - Exhaust silencer, dry type
 - Coupled decompressors
 - Lub oil sump drain pump
 - Holding down bolts : 0.5 in (12.7 mm) dia, 6 in (150 mm) long with nuts and washers, quantity : 4
 - Stern gear including 2.08 m (6 ft 10 in) long bronze tail shaft 31.75 mm (1.25 in) dia with flexible shaft log 12 deg. and outside bearing with water lubricated rubber lining
 - Propeller 3 bladed 17 in dia by 13 in pitch (430 x 330 mm)

TIMBER :

- (in addition to specification on Drwg. No. 4, IVC - 7)
- Keel 75 x 145 mm length incl.waste 6.00 m
 - Engine beds 100 x 100 mm length incl.waste 7.00 m
 - " " 50 x 100 mm " " " 16.00 m
 - Engine box, 3 sides with top :
 | plate 1.22 x 2.44 m, 10 - 12 mm thick
 - Rudder 32 x 250 mm length 1.60 m
 - Tiller 32 x 80 mm length 1.10 m

FASTENINGS :

- (in addition to specification on Drwg. No. 4, IVC - 7)
- Bolts : 10 mm (3/8 in) steel rod cut to correct size and threads cut in each end to take nuts with washers
 - 10 mm steel rod : length 7.00 m
 - Galvanized hexagonal nuts 10 mm : quantity : 50
 - Galvanized flat washers : quantity : 50

FITTINGS :

- Keel straps : galvanized half-round iron 50 mm (2 in) wide, length 2.70 m
- Propeller protection : 25 mm (1 in) galvanized pipe, flattened in each end, length 1.15 m
- Rudder gear : two sets of galvanized steel straps 150 mm with 10 mm pintles and drilled brackets to fix on transom
